

Universal Tow Bar Specification Sheet

Features

- Fits almost every type and size of 4-wheeled metal and plastic wheelie bin.
- Super strong, other so called universal tow bar kits often distort and fail.
- Sprung up tow bar for ease of use with your foot. Also avoids lost connectors.
- Designed to be used with trunnion lifting or comb bar lifting - never gets in the way.
- Fits over the castor plate which is the strongest part of the bin. Other arrangements involve brackets fixed to the bin which result in bin damage.

Specifications

- Connector bar length: 56cm.
- 6mm hot dip galvanized steel to specification EN ISO 1461.
- 30mm tug eye hole diameter.

Notes

- Two direction locks are required for the back wheels of each bin to prevent them snaking.
- The standard towing speed for normal wheels (which use roller bearings) is 4 km/h- if you plan to tow faster, use towing wheels with ball bearings that are specified for your towing speed.
